Team Name	Fortitude
Team Leader	ALaa Hassan Mohey Eldeen
Student 1 + Role	Doha Abdo Shafiq - Linux & System Environment
Student 2 + Role	Rawan Araby Abo Elezz - Speech-to-Text
Student 3 + Role	Malak Ahmed Fathi - Command Understanding/NLP
Student 4 + Role	Sara Ayman Abdelnabi - Command Execution
Student 5 + Role	Rawan Araby Abo Elezz - Text-to-Speech
Student 6 + Role	Jwayria Ahmed Ali - File & Application Management
Student 7 + Role	ALaa Hassan Mohey Eldeen - GUI / User Experience
Student 8 + Role	Shrouq Mohamed Ragab - Integration & Testing
Project Idea	Voice-Controlled Operating System — an OS that allows users to control the computer using voice commands.
Technologies	Linux / Ubuntu, Python, Speech Recognition, NLP/AI, Bash/Shell Commands.
Main Features	Voice command recognition Convert speech into text Understand and process user commands Execute system commands automatically Open and close applications using voice Basic system control through voice commands Simple and user-friendly interface

Weekly Plan	**Week 1:** Project planning, defining the system requirements, and distributing tasks among team members. **Week 2:** : Setting up the Linux/Ubuntu environment and studying the required Linux commands and system operations. **Week 3:** Implementing speech recognition and converting voice commands into text. **Week 4:** Developing the AI/NLP part to understand and process the user's voice commands. **Week 5:** Connecting the processed commands with Linux system commands and implementing command execution. **Week 6:** Integrating all components, testing the complete system, fixing errors, and improving the user interface.
Integration Plan	Integrate speech recognition, AI/NLP, Linux command execution, and the user interface into one system. The system will receive a voice command, understand it, convert it into a Linux command, and execute the requested action.
Expected Challenges	Difficulty recognizing different voices and accents. Converting speech into accurate commands. Understanding incorrect or unclear commands. Connecting AI/NLP with Linux commands. Integration and debugging between different components.
